The CC novel protein kinases have been identified as members of the tyrosine CC or serine/chreonine kinase (PTK and STM) families. The polymucleotides encoding protein kinases and the polypeptides may be used in the CC encoding protein kinases and treatment of diseases associated with CC inappropriate kinase expression. For example, they may be used to treat CC cancers (e.g. atherosclerosis), metabolic disorders (e.g. diabetes), cc immune related diseases (e.g. rheumatopoietic origin), cardiovascular CC disease (e.g. schizophrenia), neurodegenerative disorders (e.g. diabetes), CC Parkinson's disease), inflammatory disorders (e.g. sathma), infectious CC disease (e.g. HIV) and reproductive disorders (e.g. sathma), infectious CC disease (e.g. polymucleotides encoding protein kinases may be CC used for gene therapy and as DNA probes in diagnostic assays.

CC The protein kinase polypeptides may be used as antigens in the production cof antibodies against the protein kinases and in assays to identify condulators of protein kinase expression and activity.

                                                                                                                                                                                                                                                                                                                                  the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system disease, such as Alzheiner's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, harmostatic and thrombolytic activity, cancer disgnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and

Tissues that express PPHKP-5 (as a C fraction of total tissues expressing PPHKP-5) include reproductive (0.288), gastrointestinal (0.212) and haematopoietic or immune (0.192). Diseases or conditions associated with tissues expressing PPHKP-5) include reproductive (0.192). Diseases or conditions associated with tissues expressing PPHKP-5) include cancer (0.577), inflammation or trauma (0.327) and cell cancer (0.577), inflammation or trauma (0.327) and cell proliferation (0.308). The encoded protein shows homology to rat kinase. The invention provides human PPHKP-1 to -11 polypeptides (see AAB20322-32) and polynucleotides (see AAF30476-86). It also provides expression vectors, host cells, antibodies, agonists and antagonists, as well as methods for diagnosing, treating or preventing disorders associated with expression of PPHKP, including gastrointestinal disorders, immune system disorders, neurological disorders and cell proliferative disorders, including cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                               the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat disease of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system disease, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and

The invention provides an isolated human tribbles homologue-1 (htrb-1, CC also known as stress kinase inhibitor procein (SKIP-1)) polypeptide. The christian procein (SKIP-1) polypeptide. The cC htrb polypeptide is useful for inhibiting an AP-1 mediated inflammatory cC signal in a cell. The polypeptide employed in the method is preferably chrb-1, htrb-1 N htrb-1 C, htrb-1 N C, htrb-3, htrb-3 C, or cC htrb-3 N C. It is also useful for providing htrb agonist activation cc signal, an estrogen receptor-mediated signal, or a pMA induced signal, an cC signal, an estrogen receptor-mediated signal, or a pMA induced signal, an cc litth modulators are useful for modulating AP-1 mediated compounds in a cell such as tumor necrosis factor (TNF) c induced inflammatory signal, or an interleukin induced inflammatory compounds e.g. for in screening assays, predictive medicine cc and in therapeutics or prophylactics. The htrb proteins are useful for compounds e.g. for treating and/or preventing diseases caused by abnormal htrb activity, such as rheumacoid arthrits, diabetes, compounds e.g. for treating and/or preventing diseases caused compounds e.g. for treating and/or preventing diseases caused by abnormal htrb activity, such as rheumacoid arthrits, diabetes, compounds in the appetite are useful for antagonizing conformation or autoimmune disorders. The present sequence represents can dinflammation or autoimmune disorders. The present sequence represents cc the htrb-1 novement ide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  opthalamological; cardiant; cyrostatic; haemostatic; immunosuppressive; antinflammatory; estrogen receptor; fibroblast growth factor; FGF; tumour necrosis factor; TNF; htrb-3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel isolated human tribbles homologue-1 polypeptide for inhibiting AP-1-mediated inflammatory signal in a cell, and activating ERK-mediated signal e.g. AP-1-mediated gene activation signal in a constant (A_{\rm c})^2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Dower

```
The present sequence represents a partial polypeptide which has kinase activity. The kinase polynucleotides can be used to express the polypeptides, and as probes to identify nucleic acids encoding proteins having kinase activity. The kinase polypeptides and fragmented polypeptides are used as molecular weight and isoelectric focusing markers, and as controls for peptide fragmentation. They also have a number of therapeutic uses as kinases play a central role in cellular signal transduction. The polypeptides could also be used to identify binding partner proteins. The polypeptides can also be used as a reagent to identify any proteins that the polypeptide regulates, and proteins with which it might interact. The polypeptides can be used as used for preparation of antibodies. The antibodies can be used in assays to detect the presence of the protein, and to purify the protein by immunoaffinity chromatography.

The invention provides PKIN. The PKIN polypept

polypeptides

human kinases (PKIN) a

and polynucleotides encoding using standard recombinant

Claim 1; Page 115; 126pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          methodology. The PKIN polypeptides, polynucleotides, modulators and specific antibodies are useful in the diagnosis, treatment and prevention of cancer, immune disorders, disorders affecting growth and development, atherosclerosis, and sorder cardiovascuar diseases, and lipid disorders and in the assessment of the effects of exogenous compounds on the expression of nucleic acid sequences of human kinases. The present sequence represents a human PKIN-10 polypeptide.

CC include: cytostatic; proliferative; vulnerary; immunomodulator; CC antidiabetic; antiasthmatic; antirheumatic; antiarthritic; antivitasthmatic; antialthritic; antialitadiabetic; antiasthmatic; antialthritic; CC antiinflammatory; antithyroid; antiallergic; antibacterial; antivital; CC antiinflammatory; antithyroid; cardiant; thrombolytic; coagulant; CC dermatological; neuroprotective; cardiant; thrombolytic; coagulant; CC nootropic; vasotropic; antipsoriatic and antianglogenic. The CC polynucleotides and polypeptides can be used for preventing, treating or CC northing medical conditions and diagnosing pathological conditions. CC polynucleotides, polypeptides, antibodies, sonists and antagonists from CC immune colls; the proliferation, differentiation or mobilisation of CC immune colls, to treat disorders of haematopoletic cells, autoimmune CC disorders, modulate haemostatic or thrombolytic activity, modulate rejection, cancers, cardiovascular disorders, neurological disease and CC bacterial or viral infections. The peptides, nucleotides, antibodies, agonists and antagonists may be also be used in drug screens. AAC/8449 to AAR/8459 and AAR/84240 represent sequences used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              in AAB43398 to AAB44239. The proteins can have activities based on it tissues and cells the genes are expressed in. Example of activities include: cytostatic; proliferative; uninexact.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel isolated nucleic useful for treating or

```
CC encoding the proteins given in ABB06037 to ABB06164. The novel sequences (NS) can have cytostatic, osteopathic, synascological, neuroprotective, antirheumatic, antiarthritic, antiporiatic, ophthalmological, virucide, care vasotropic, antiarterioselerotic, antiinflammatory, dermatological, cardiant, antifibrinolytic, antiinflammatory, dermatological, cardiant, cardiovascular, antifibrinolytic, antidiabetic, cardiovascular, cardiovascular, cardiovascular, antidiabetic, cardiovascular, cardiovascular, antidiabetic, cardiovascular, cardiovascular, antidepressant, gastrointestinal, aeuroleptic, cerebroprotective, antidepressant, gastrointestinal, aeuroleptic, cerebroprotective, cardiovascular, antidepressant, gastrointestinal, aeuroleptic, cerebroprotective, contropic and contraceptive activities. The NS can be used in vaccines, cerebroprotective, antibodiss from the present invention can be used for treating and contropic and antisonascular cardiovascular, steroposis, multiple sclerosis, redometriosis, degenerative disease, dystonia, multiple sclerosis, rheumatoid arthritis, psoriasis, cataracts, restenosis, atherosclerosis, inflammation, skin disorders, cataracts, restenosis, atherosclerosis, inflammation, skin disorders, cataracts, restenosis, atherosclerosis, infertility, cardiovascular contesses, epilepsy, angina, neurodegeneration, disbetes, anxiety, anticut, antidisease, infertility, cardiovascular, contessed, schemia, viral disease, gastric ulcers, stroke, altheimar's disease and as contraceptive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

Mintz L, Freilich S,

One hundred and twenty eight novel nucleic acid sequences, useful for treating and diagnosing e.g. cancer, asthma and Alzheimer's -

Claim 6; Page 231-232; 290pp; English.

CC encoding the proteins given in ABB06037 to ABB06164. The novel sequences (CNS) can have cytostatic, osteopathic, synascological, neuroprotective, cantirheumatic, antiarthritic, antipsoriatic, ophthalmological, virucide, CC antirheumatic, antiarteriosclerotic, antiinfelmmatory, dermatological, CC anorectic, muscular, anti-HIV, antiinfertility, cardiovascular, CC anticosgulant, antifibrinolytic, hypotension, antiasthmatic, cardiant, CC immunomodulator, anticonvulsant, antidiabetic, tranquilliser, antiulcer, CC antidepressant, gastrointestinal, aeuroleptic, cerebroprotective, CC noctropic and contraceptive activities. The NS can be used in vaccines, CC gene therapy and antisense therapy. Nucleic acids, expression vectors and CC diseases, go, cancer, osteoporosis, endometriosis, degenerative CC diseases, dystonia, multiple sclerosis, rheumatoid arthritis, psoriasis, CC cataracts, restenosis, atherosclerosis, inflammation, skin disorders, CC glaucoma, obesity, muscular dystrophy, AIDS, infertility, cardiovascular CC disease, coagulation disease, inclammation, skin disorders, CC disease, schippsy, angina, neurodegeneration, disbetee, anxiety, CC depression, schizophrenia, viral disease, gastric ulcers, stroke, CV Alzheimer's disease and as contraceptive. ABL39691 to ABL39818 represent novel human nucleic acid sequences encoding the proteins given in ABB06037 to ABB06164. The novel sequences and

The invention provides an isolated human tribbles homologue-1 (htrb-1, also known as stress kinase inhibitor protein (SKIP-1)) polypeptide. The htrb polypeptide is useful for inhibiting an AP-1 mediated inflammatory signal in a cell. The polypeptide employed in the method is preferably htrb-3 N c. It is also useful for providing htrb agonist activity for activating an ERK-mediated signal e.g. AP-1-mediated gene activation signal, an estrogen receptor-mediated gene activation signal, an estrogen receptor-mediated gene activation signal, an a cell. Htrb modulators are useful for modulating AP-1 mediated inflammatory signal in a cell such as tumor necrosis factor (TMP) induced inflammatory signal in a cell such as tumor necrosis factor (TMP)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; tribbles; htrb-1; stress kinase inhibitor protein; SKIP-1; AP-1; antirhoumatic; antiarthritic; antidiabetic; antipsoriatic; osteopathic; opthalamological; cardiant; cytostatic; haemostatic; immunosuppressive; antinfilammatory; estrogen receptor; fibroblast growth factor; FGF; tumour necrosis factor; TNF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel isolated human tribbles homologue-1 polypeptide for inhibiting AP-1-mediated inflammatory signal in a cell, and activating ERK-mediated signal e.g. AP-1-mediated gene activation signal in a cell
                                                                                                                                                                                                                                                                                                                                                                                              Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               08-JAN-2001; 2001US-260294P

The htrb proteins are useful for screening compounds e.g. for treating and/or preventing diseases caused by abnormal htrb activity, such as rheumatoid arthritis, diabetes, psorissis, osteoporosis, diabetic retinopathy, myocardial infarction and cancers. The htrb therapeutics are useful for antagonizing interleukin-1 dependent disorders of human placenta, intraventricular hemorrhage, neonatal white matter damage and subsequent cerebral palsy; and inflammation or autoimmune disorders. The present sequence represents the htrb-1 polypeptide.

cc and polynucleotides (II) (II) and (II) are useful for treating inflammatory conditions such as arthitis, nephitis, Crohn's disease, cc inchaemia reperfusion injury, shock, sepsis, immune responses, and is ci sichaemia reperfusion injury, shock, sepsis, immune responses, and is cc involved in increasing haematopolesis, stem cell survival, bone growth cc and remodeling, (I), (II) and modulators of (II) are useful for creating transgenic animals useful for studying the in vivo activities of (C prophylaxis or treatment of one or more cancers. (II) is also useful for the polypeptide as well as for studying modulators of the polypeptides. (I) induces the proliferation of neural cells and regeneration of nerve cc and brain tissue and is useful for the treatment of central and cc parigheral nervous system diseases and neuropathies, such as Alzheimer's, cr parkinson's diseases and neuropathies, such as Alzheimer's, cativity, regulation of haematopoises and is useful for treating myeloid cc activity, regulation of haematopoises and is useful for treating myeloid cc and for regeneration of bone, cartilage, tendon, ligament and/or nerve tissue growth, and in tissue repair, healing of burns, incisions, cu lears, for treating osteoporosis, osceoarthritis, bone degenerative disorders, for treating severe combined immune deficiencies and cc disorders including severe combined immune deficiency (SCID), bacterial or fungal infections, autoimmune disorders e.g. multiple sclerosis, respectively and can act as an antigen in a vaccine composition to raise an colar sequences of the tinyantion.

Example 2 SEQ ID No 680; 107pp; English.

The invention relates to novel isolated human secreted polypeptides (I) CC and polynucleotides (II). (I) and (II) are useful for treating CC inflammatory conditions such as arthritis, nephritis, Crohn's disease, CC ischaemia-reperfusion injury, shock, sepsie, immune responses, and is CC involved in increasing haematopolesis, stem cell survival, bone growth CC and remodeling. (I), (II) and modulators of (II) are useful for CC prophylaxis or treatment of one or more cancers. (II) is also useful for CC creating transgenic animals useful for studying the in vivo activities of the polypeptide as well as for studying modulators of the polypeptides. (I) induces the proliferation of neural cells and regeneration of nerve and brain tissue and is useful for the treatment of central and cCC entipheral nervous system diseases and neuropathies, such as Alzheimer's, CC Parkinson's disease, Huntington's disease, and amyotrophic lateral CC excivity, regulation of haematopoiesis and is useful for treating myeloid or sclerosis. In addition, (I) is involved in chemotactic or chemokinetic corruphoid cell disearchers, platelet disorders such as thrombocytopenia and for regeneration of bone, cartilage, tendon, ligament and/or nerve tissue growth, and in tissue repair, healing of burns, incisions,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CC ulcers, for treating osteoporosis, osteoarthritis, bone degenerative CC disorders, or periodontal disease. Furthermore, (I) is also useful for CC gut protection or regeneration and treatment of lung or liver fibrosis, CC reperfusion injury in various tissues, various immune deficiencies and disorders including severe combined immunodeficiency (SCID), bacterial or CC fungal infections, autoimmune disorders e.g. multiple sclerosis, creations and conditions, such as asthma or other respiratory problems. CC reactions and conditions, such as asthma or other respiratory problems. CI in addition, (I) affects biorhythms or circadian cycles of rhythms, CC fertility, metabolism, catabolism, anabolism, storage or elimination of CC dietary fat, lipid, protein, carbohydrate, vitamins, minerals, provides analgesic effects or other pain reducing effects, immunoglobulin like CC analgesic effects or other pain reducing effects, immunoglobulin like CC cativity and can act as an antigen in a vaccine composition to raise an immune response. AAU28020-AAU28395 represent novel human secreted protein composition acid sequences of the invention.

                                                                                                                                                               Diagnosing, preventing, treating and prognosticating a cancer in a mammal by detecting and measuring the CBFW gene copy number and/or CB level, useful for breast, brain, lung, colon, ovarian and/or prostate
                                                                                                                                                                            CBFW
```

The present invention describes a method for diagnosing a cancer in a mammal. The method comprises detecting and measuring the C8FW gene copy number or level in a biological subject from a region of the mammal that is suspected to be pre-cancerous or cancerous to generate data for a test gene copy, and comparing the test gene copy number or level to a data for a control gene copy number or level, where an amplification of the gene in the biological subject relative to the control indicates the presence of a pre-cancerous lesion or cancer in the animal. C8FW has cytostatic activity, and can be used in vaccines. The method can be used for the diagnosis, prevention, treatment and prognostication of breast, colon, lung, brain, prostate and/or ovarian cancer. The present sequence represents human C8FW from the present invention. C8FW is a phosphoprotein regulating mitogenic pathway protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invent: useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG1617-ABLIG171), expressed DNA sequences (ABLIG187-ABLIG175) and the encoded proteins (ABB7737-ABB72072).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI; 2001-656860/75.

Biophys. Res. Commun. 258:260-264(1999).

-!- FUNCTION: May play an important role in a common pathway leading to programmed neuronal cell death. Does not appear to function in the programmed death of non-neuronal cells. May serve as an endogenous antagonist competing for substrate with functional kinases that act to promote neuronal cell survival.

-!- TISSUE SPECIFICITY: Detected only in the lung. Not detected in the heart, brain, spleen, liver, skeletal muscle, kidney and testis.

-!- INDUCTION: Expression induced during programmed cell death evoked in neuronal cells by NGP-depletion.

-!- SIMILARITY: Contains 1 protein kinase domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This SWISS-PROT entry is copyright.
